Package 'SigBridgeR'

October 19, 2025

Title Multi-algorithm Integration of Phenotypic, scRNA-seq, and Bulk Data for Cell Screening

Version 2.5.2

Description SigBridgeR is an integrative toolkit designed to identify phenotype-associated cell subpopulations by combining phenotype(e.g. survival, drug sensitivity), bulk expression and single-cell RNA-seq data. It leverages multiple algorithms (including 'Scissor', 'scPAS', 'scPP', 'scAB' and 'DEGAS') to robustly link cell features with clinical or functional phenotypes. The package provides a unified pipeline for cross-modal data analysis, enabling the discovery of biologically and clinically relevant cell states in heterogeneous samples.

Contents

`AddMisc` *Safely Add Miscellaneous Data to Seurat Object*

Description

Adds arbitrary data to the `@misc` slot of a Seurat object with automatic key conflict resolution. If the key already exists, automatically appends a numeric suffix to ensure unique key naming (e.g., "mykey_1", "mykey_2").

Usage

```
AddMisc(
  seurat_obj,
  ..., # key = value
  cover = TRUE # overwrite existing data
)
```

Arguments

`seurat_obj`	A Seurat object to modify
`...`	key-value pairs to add to the `@misc` slot.
`cover`	Logical indicating whether to overwrite existing data. If (default TRUE).

Value

The modified Seurat object with added `@misc` data. The original object structure is preserved with no other modifications.

Key Generation Rules

1. If `key` doesn't exist: uses as-is
2. If `key` exists: appends the next available number (e.g., "key_1", "key_2")
3. If numbered keys exist (e.g., "key_2"): increments the highest number

Examples

```
## Not run:
# Basic usage
seurat_obj <- AddMisc(seurat_obj, "QC_stats" = qc_df)

# Auto-incrementing example
seurat_obj <- AddMisc(seurat_obj, markers = markers1)
seurat_obj <- AddMisc(seurat_obj, markers = markers2, cover=FALSE)
# Stores as "markers" and "markers_1"

## End(Not run)
```

`BulkPreProcess` *Bulk RNA-seq Data Preprocessing and Quality Control Function*

Description

This function performs comprehensive preprocessing and quality control analysis for bulk RNA-seq data, including data validation, filtering, batch effect detection, principal component analysis, and visualization.

Usage

```
BulkPreProcess(
  data,
  sample_info = NULL,
  gene_symbol_conversion = FALSE,
  check = TRUE,
  min_count_threshold = 10,
  min_gene_expressed = 3,
  min_total_reads = 1e+06,
  min_genes_detected = 10000,
  min_correlation = 0.8,
  n_top_genes = 500,
  show_plot_results = TRUE,
  verbose = TRUE
)
```

Arguments

`data`	Expression matrix with genes as rows and samples as columns, or a list containing count_matrix and sample_info
`sample_info`	Sample information data frame (optional), ignored if data is a list. A qualified `sample_info` should contain both `sample` and `condition` columns (case-sensitive), and there are no specific requirements for the data type stored in the `condition` column.
`gene_symbol_conversion`	Whether to convert Ensembles version IDs and TCGA version IDs to genes with IDConverter, default: FALSE
`check`	Whether to perform detailed quality checks, default: TRUE
`min_count_threshold`	Minimum count threshold for gene filtering, default: 10
`min_gene_expressed`	Minimum number of samples a gene must be expressed in, default: 3
`min_total_reads`	Minimum total reads per sample, default: 1e6
`min_genes_detected`	Minimum number of genes detected per sample, default: 10000

`min_correlation`
: Minimum correlation threshold between samples, default: 0.8

`n_top_genes`
: Number of top variable genes for PCA analysis, default: 500

`show_plot_results`
: Whether to generate visualization plots, default: TRUE

`verbose`
: Whether to output detailed information, default: TRUE

Details

The function performs the following operations:

1. Data validation and format conversion
2. Basic statistics calculation (missing values, read depth, gene detection)
3. Optional detailed quality checks including:
   - Sample correlation analysis
   - Principal Component Analysis (PCA)
   - Outlier detection using Mahalanobis distance
   - Batch effect detection using ANOVA
4. Data filtering based on count thresholds and quality metrics
5. Optional gene symbol conversion
6. Visualization generation (PCA plots)

Value

Filtered count matrix

Quality Metrics

The function calculates and reports several quality metrics:

Data Integrity Number of missing values

Gene Count Total number of genes after filtering

Sample Read Depth Total reads per sample

Gene Detection Rate Number of genes detected per sample

Sample Correlation Pearson correlation between samples

PCA Variance Variance explained by first two principal components

Batch Effects Proportion of genes significantly affected by batch

Sample Information Format

The sample_info data frame should contain:

sample Character vector of unique sample identifiers

condition Character vector of experimental conditions

batch Optional character vector of batch identifiers

Filtering Criteria

Genes are retained if:

- They have counts >= min_count_threshold in >= min_gene_expressed samples

Samples are retained if:

- Total reads >= min_total_reads
- Detected genes >= min_genes_detected
- Mean correlation >= min_correlation (if check=TRUE)

See Also

`cpm` for counts per million calculation, `prcomp` for PCA analysis, `cor` for correlation analysis, `RowVars` for variance calculation of each row, `SymbolConvert` for gene symbol conversion

---

`FindRobustElbow` *Automatically determine optimal PCA dimensions using multiple robust methods*

Description

This function combines multiple statistical approaches to automatically determine the optimal number of principal components (PCs) for downstream single-cell analysis. It integrates variance-based heuristics, elbow detection algorithms, and provides comprehensive visualization for result validation.

Usage

```
FindRobustElbow(obj, verbose = TRUE, ndims = 50)
```

Arguments

`obj`	A Seurat object that has PCA computed (after RunPCA)
`verbose`	Logical, if TRUE outputs detailed method results and creates visualization plot. If FALSE returns only the final dimension.
`ndims`	Integer, maximum number of dimensions to consider (default: 50)

Value

Integer, the recommended number of PCA dimensions for downstream analysis

See Also

Other single_cell_preprocess: `ClusterAndReduce()`, `FilterTumorCell()`, `ProcessSeuratObject()`

Examples

```
## Not run:
# After running PCA on Seurat object
pbmc <- RunPCA(pbmc, npcs = 50)
optimal_dims <- FindRobustElbow(pbmc, verbose = TRUE)
pbmc <- FindNeighbors(pbmc, dims = 1:optimal_dims)

## End(Not run)
```

ListPyEnv *List Available Python Environments*

Description

Discovers and lists available Python environments of various types on the system. This generic function provides a unified interface to find Conda environments and virtual environments (venv) through S3 method dispatch.

Default method that lists all Python environments by combining results from Conda and virtual environment discovery methods.

Discovers Conda environments using multiple detection strategies for maximum reliability. First attempts to use system Conda commands, then falls back to reticulate's built-in Conda interface if Conda command is unavailable or fails. Returns empty data frame if Conda is not available or no environments are found.

Discovers virtual environments by searching common venv locations including user directories (`~/.virtualenvs`, `~/.venvs`) and project folders (`./venv`, `./.venv`). Supports custom search paths through the `venv_locations` parameter. Returns empty data frame if no virtual environments are found in the specified locations.

Usage

```
ListPyEnv(
  env_type = c("all", "conda", "venv", "virtualenv"),
  timeout = 30000,
  venv_locations = c("~/.virtualenvs", "~/.venvs", "./venv", "./.venv"),
  verbose = TRUE,
  ...
)

## Default S3 method:
ListPyEnv(
  env_type = c("all", "conda", "venv", "virtualenv"),
  timeout = 30000,
  venv_locations = c("~/.virtualenvs", "~/.venvs", "./venv", "./.venv"),
  verbose = TRUE,
  ...
```

```
)

## S3 method for class 'conda'
ListPyEnv(
  env_type = c("all", "conda", "venv", "virtualenv"),
  timeout = 30000,
  venv_locations = c("~/.virtualenvs", "~/.venvs", "./venv", "./.venv"),
  verbose = TRUE,
  ...
)

## S3 method for class 'venv'
ListPyEnv(
  env_type = c("all", "conda", "venv", "virtualenv"),
  timeout = 30000,
  venv_locations = c("~/.virtualenvs", "~/.venvs", "./venv", "./.venv"),
  verbose = TRUE,
  ...
)
```

Arguments

`env_type`	Character string specifying the type of environments to list. One of: `"all"`, `"conda"`, `"venv"`. Defaults to `"all"`.
`timeout`	The maximum timeout time when using system commands, only effective when `env_type=conda`.
`venv_locations`	Character vector of directory paths to search for virtual environments. Default includes standard locations and common project directories.
`verbose`	Logical indicating whether to print verbose output.
`...`	For future use.

Details

The function uses S3 method dispatch to handle different environment types:

- `"all"`: Combines results from all environment types using `rbind()`
- `"conda"`: Searches for Conda environments using multiple methods:
  - Primary: `reticulate::conda_list()` for reliable environment detection
  - Fallback: System `conda info --envs` command for broader compatibility
- `"venv"`: Searches common virtual environment locations including user directories and project folders

Each method includes comprehensive error handling and will return empty results with informative warnings if no environments are found or if errors occur during discovery.

Value

A data frame with the following columns:

- name - Character vector of environment names
- python - Character vector of paths to Python executables
- type - Character vector indicating environment type ("conda" or "venv")

Returns an empty data frame with these columns if no environments are found.

Examples

```
## Not run:
# List all Python environments
ListPyEnv("all")

# List only Conda environments
ListPyEnv("conda")

# List only virtual environments with custom search paths
ListPyEnv("venv", venv_locations = c("~/my_envs", "./project_env"))

## End(Not run)
```

LoadRefData *Download & Load Reference Data*

Description

This function checks if the data already exists in a local cache. If not, it downloads the file from the remote repository using multiple sources with fallback.

Usage

```
LoadRefData(
  data_type = c("survival", "binary", "continuous"),
  path = NULL,
  cache = TRUE,
  timeout = 60
)
```

Arguments

data_type	The type of data to download. Must be one of "survival", "binary", or "continuous".
path	Optional path to save the downloaded file, default: NULL, saving in package.
cache	Logical. If TRUE (default), saves the data for future sessions.
timeout	Integer. Connection timeout in seconds (default: 60).

Value

The requested datasets, stored in a list.

Examples

```
## Not run:
ref_data <- LoadRefData(data_type = c("survival"))

## End(Not run)
```

`MergeResult` *Merge Multiple Screening Analysis Results*

Description

Combines results from multiple single-cell screening analyses (Scissor, scPAS, scPP, or scAB) by merging their metadata and miscellaneous information while preserving the original expression data. Performs an inner join on cell barcodes to ensure only cells present in all inputs are retained.

Usage

```
MergeResult(...)
```

Arguments

`...`	Input objects to merge. Can be: - Seurat objects - Lists containing `scRNA_data` (Seurat objects) - Mixed combinations of the above - The first one will be used as base object for merging, priority given to first one when duplicate columns are found

Value

A merged Seurat object containing:

- Expression data from the first input object
- Combined metadata from all input objects
- Miscellaneous information from all input objects
- Only cells present in all input objects (inner join)

Processing Details

1. Input Validation: Checks for valid Seurat objects or lists containing Seurat objects
2. Metadata Extraction: Collects metadata from all objects
3. Cell Intersection: Retains only cells present in all datasets
4. Object Merging: Creates new Seurat object with combined metadata
5. Miscellaneous: Adds miscellaneous information to the merged object

Examples

```
## Not run:
# Merge mixed analysis types
combined <- MergeResult(scissor_output, scAB_output, scPP_output)

# Merge list-containing objects
merged_list <- MergeResult(list1, list2, seurat_obj)

## End(Not run)
```

SCPreProcess *Single-Cell RNA-seq Preprocessing Pipeline*

Description

A generic function for standardized preprocessing of single-cell RNA-seq data from multiple sources. Handles data.frame/matrix, AnnData, and Seurat inputs with tumor cell filtering. Implements a complete analysis pipeline from raw data to clustered embeddings.

Usage

```
SCPreProcess(sc, ...)

SCPreProcess(sc, ...)

## Default S3 method:
SCPreProcess(sc, ...)

## S3 method for class 'matrix'
SCPreProcess(
  sc,
  meta_data = NULL,
  column2only_tumor = NULL,
  project = glue::glue("SC_Screening_Proj"),
  min_cells = 400,
  min_features = 0,
  quality_control = TRUE,
  quality_control.pattern = c("^MT-", "^mt-"),
  data_filter = TRUE,
  data_filter.nFeature_RNA_thresh = c(200, 6000),
  data_filter.percent.mt = 20,
  normalization_method = "LogNormalize",
  scale_factor = 10000,
  scale_features = NULL,
  selection_method = "vst",
  resolution = 0.6,
```

```
  dims = seq_len(10),
  verbose = TRUE,
  ...
)

## S3 method for class 'data.frame'
SCPreProcess(
  sc,
  meta_data = NULL,
  column2only_tumor = NULL,
  project = glue::glue("SC_Screening_Proj"),
  min_cells = 400,
  min_features = 0,
  quality_control = TRUE,
  quality_control.pattern = c("^MT-", "^mt-"),
  data_filter = TRUE,
  data_filter.nFeature_RNA_thresh = c(200, 6000),
  data_filter.percent.mt = 20,
  normalization_method = "LogNormalize",
  scale_factor = 10000,
  scale_features = NULL,
  selection_method = "vst",
  resolution = 0.6,
  dims = seq_len(10),
  verbose = TRUE,
  ...
)

## S3 method for class 'dgCMatrix'
SCPreProcess(
  sc,
  meta_data = NULL,
  column2only_tumor = NULL,
  project = glue::glue("SC_Screening_Proj"),
  min_cells = 400,
  min_features = 0,
  quality_control = TRUE,
  quality_control.pattern = "^MT-",
  data_filter = TRUE,
  data_filter.nFeature_RNA_thresh = c(200, 6000),
  data_filter.percent.mt = 20,
  normalization_method = "LogNormalize",
  scale_factor = 10000,
  scale_features = NULL,
  selection_method = "vst",
  resolution = 0.6,
  dims = seq_len(10),
  verbose = TRUE,
```

```
  ...
)

## S3 method for class 'AnnDataR6'
SCPreProcess(
  sc,
  meta_data = NULL,
  column2only_tumor = NULL,
  project = glue::glue("SC_Screening_Proj"),
  min_cells = 400,
  min_features = 0,
  quality_control = TRUE,
  quality_control.pattern = c("^MT-", "^mt-"),
  data_filter = TRUE,
  data_filter.nFeature_RNA_thresh = c(200, 6000),
  data_filter.percent.mt = 20,
  normalization_method = "LogNormalize",
  scale_factor = 10000,
  scale_features = NULL,
  selection_method = "vst",
  resolution = 0.6,
  dims = seq_len(10),
  verbose = TRUE,
  ...
)

## S3 method for class 'Seurat'
SCPreProcess(sc, column2only_tumor = NULL, verbose = TRUE, ...)
```

Arguments

`sc`	Input data, one of: • `data.frame/matrix/dgCMatrix`: Raw count matrix (features x cells) • `AnnDataR6`: Python AnnData object via reticulate • `Seurat`: Preprocessed Seurat object
`...`	Method-specific arguments (see below)
`meta_data`	Optional metadata dataframe (rows = cells, columns = attributes)
`column2only_tumor`	Metadata column used for filtering tumor cells, matching patterns such as "tumor" (or "tumour"), "cancer", "malignant", or "neoplasm" (case-insensitive).
`project`	Project name for Seurat object
`min_cells`	Minimum cells per gene to retain (features present in at least this many cells)
`min_features`	Minimum features per cell to retain (cells with at least this many features)
`quality_control`	Logical indicating whether to perform mitochondrial QC
`quality_control.pattern`	Regex pattern to identify mitochondrial genes (e.g., "^MT-" for human)

`data_filter` Logical indicating whether to filter low-quality cells

`data_filter.nFeature_RNA_thresh`
Numeric vector of length 2 specifying (min, max) features per cell

`data_filter.percent.mt`
Maximum mitochondrial percentage allowed (0-100)

`normalization_method`
Normalization method ("LogNormalize", "CLR", or "RC")

`scale_factor` Scaling factor for normalization

`scale_features` Scale features to unit variance

`selection_method`
Variable feature selection method ("vst", "mvp", or "disp")

`resolution` Cluster resolution (higher for more clusters)

`dims` PCA dimensions to use

`verbose` Print progress messages

Value

A Seurat object containing:

- Data filter and quality control
- Normalized and scaled expression data
- Variable features
- PCA/tSNE/UMAP reductions
- Cluster identities
- When tumor cells filtered: original dimensions in `@misc$raw_dim`
- Final dimensions in `@misc$self_dim`

`Screen` *Single-Cell Data Screening*

Description

Integrates matched bulk expression data and phenotype information to identify phenotype-associated cell populations in single-cell RNA-seq data using one of four computational methods. Ensures consistency between bulk and phenotype data before analysis.

Usage

```
Screen(
  matched_bulk,
  sc_data,
  phenotype,
  label_type = NULL,
  phenotype_class = c("binary", "survival", "continuous"),
  screen_method = c("Scissor", "scPP", "scPAS", "scAB", "DEGAS"),
  ...
)
```

Arguments

`matched_bulk` Matrix or data frame of preprocessed bulk RNA-seq expression data (genes x samples). Column names must match names/IDs in `phenotype`.

`sc_data` A Seurat object containing scRNA-seq data to be screened.

`phenotype` Phenotype data, either: - Named vector (names match `matched_bulk` columns), or - Data frame with row names matching `matched_bulk` columns

`label_type` Character specifying phenotype label type (e.g., "SBS1", "time")

`phenotype_class` Type of phenotypic outcome (must be consistent with input data): - `"binary"`: Binary traits (e.g., case/control) - `"continuous"`: Continuous measurements - `"survival"`: Survival objects

`screen_method` Screening algorithm to use, there are four options: - `"Scissor"`: see also `DoScissor()` - `"scPP"`: see also `DoscPP()` - `"scPAS"`: see also `DoscPAS()` - `"scAB"`: see also `DoscAB()`, no continuous support - `"DEGAS"`: see also `DoDEGAS()`

`...` Additional method-specific parameters:

Scissor **alpha** (numeric or NULL) Significance threshold. When NULL, alpha will keep increasing iteratively until the corresponding cells are screened out, default 0.05

cutoff (numeric) A threshold for terminating the iteration of alpha, only work when `alpha` is NULL, default 0.2

path2load_scissor_cache (character) default `NULL`

path2save_scissor_inputs (character) A path to save the intermediary data. By using `path2load_scissor_cache`, the intermediary data can be loaded from the specified path. default `"Scissor_inputs.RData"`

reliability_test (logical) Whether to perform reliability test, default FALSE

reliability_test.nfold (integer) Cross-validation folds for reliability test, default 10

reliability_test.n (integer) Number of cells to use for reliability test, default 10

cell_evaluation (logical) Whether to perform cell evaluation, default FALSE

cell_evaluation.benchmark_data .RData Benchmark data for cell evaluation, default NULL

cell_evaluation.FDR (numeric) FDR threshold for cell evaluation, default 0.05

cell_evaluation.bootstrap_n (integer) Number of bootstrap samples for cell evaluation, default 10

scPP **ref_group** (integer or character) Reference group or baseline for **binary** comparisons, e.g. "Normal" for Tumor/Normal studies and 0 for 0/1 case-control studies. default: 0

Log2FC_cutoff (numeric) Minimum log2 fold-change for binary markers, default 0.585

estimate_cutoff (numeric) Effect size threshold for **continuous** traits, default 0.2

probs (numeric) Quantile cutoff for cell classification, default 0.2

scPAS assay (character) Assay to use from sc_data, default "RNA"

imputation (logical) Whether to perform imputation, default FALSE

nfeature (integer) Number of features to select, default 3000

alpha (numeric or NULL) Significance threshold, When NULL, alpha will keep increasing iteratively until the corresponding cells are screened out, default 0.01

independent (logical) The background distribution of risk scores is constructed independently of each cell. default: TRUE

network_class (character) Network class to use. default: 'SC', indicating gene-gene similarity networks derived from single-cell data. The other one is 'bulk'.

permutation_times (integer) Number of permutations, default 2000

FDR_threshold (numeric) FDR value threshold for identifying phenotype-associated cells default 0.05

scAB alpha (numeric) Coefficient of phenotype regularization ,default 0.005

alpha_2 (numeric) Coefficent of cell-cell similarity regularization, default 5e-05

maxiter (integer) NMF optimization iterations, default 2000

tred (integer) Z-score threshold, default 2

DEGAS sc_data.pheno_colname (character) Phenotype column name in sc_data, default "NULL"

select_fraction (numeric) Fraction of cells to select for DEGAS, default 0.05

tmp_dir (character) Temporary directory for DEGAS, default "NULL"

env_params (list) Environment parameters for DEGAS, default "list()"

degas_params (list) DEGAS parameters, default "list()"

normality_test_method (character) Normality test method for DEGAS, default "jarque-bera"

Value

A list containing:

scRNA_data Filtered Seurat object with phenotype-associated cells

Some screen_result Important information about the screened result related to the selected method

Data Matching Requirements

- `matched_bulk` column names and `phenotype` names/rownames must be identical
- Phenotype values must correspond to bulk samples (not directly to single cells)
- Mismatches will trigger an error before analysis begins, and there is a built-in pre-run check.

Method Compatibility

Method	Supported Phenotypes	Additional Parameters
Scissor	All three types	alpha, cutoff, path2load_scissor_cache, path2save_scissor_inputs, reliabil
scPP	All three types	ref_group, Log2FC_cutoff, estimate_cutoff, probs
scPAS	All three types	n_components ,assay, imputation,nfeature, alpha,network_class,permutation_t
scAB	Binary/Survival	alpha, alpha_2, maxiter, tred
DEGAS	All three types	sc_data.pheno_colname,select_fraction,tmp_dir,env_params,degas_params,nor

ScreenFractionPlot *Visualization of Cell Screening Fractions*

Description

Generates stacked bar plots showing the proportion of cells classified as Positive/Negative/Neutral by single-cell screening algorithms (Scissor, scPAS, scPP, or scAB) across different sample groups. Supports both single and multiple screen types visualization.

Usage

```
ScreenFractionPlot(
  screened_seurat,
  group_by = "Source",
  screen_type = c("scissor", "scPAS", "scPP", "scAB", "DEGAS"),
  show_null = FALSE,
  plot_color = NULL,
  show_plot = TRUE,
  plot_title = "Screen Fraction",
  stack_width = 0.85,
  x_text_angle = 45,
  axis_linewidth = 0.8,
  legend_position = "right",
  x_lab = NULL,
```

```
  y_lab = "Fraction of Status",
  ncol = 2,
  nrow = NULL,
  scales = "fixed"
)
```

Arguments

screened_seurat	A Seurat object containing screening results in metadata. Must contain columns corresponding to screen_type.
group_by	Metadata column name for grouping samples (default: "Source").
screen_type	Screening algorithm(s) used. Can be a single value or vector. Must match metadata column(s) (case-sensitive, e.g., "scissor" for Scissor results).
show_null	Logical whether to show groups with zero cells (default: FALSE).
plot_color	Custom color palette (named vector format): - Required names: "Positive", "Negative", "Neutral" - Default: c("Neutral"="#CECECE", "Other"="#CECECE", Positive"="#ff3333", "Negative"="#386c9b")
show_plot	Logical to immediately display plot (default: TRUE).
plot_title	Plot title (default: "Screen Fraction"). When multiple screen types, can be a vector of titles or single title (will append screen type).
stack_width	Bar width (default: 0.85).
x_text_angle	X-axis label angle (default: 45).
axis_linewidth	Axis line thickness (default: 0.8).
legend_position	Legend position (default: "right").
x_lab	X-axis label (default: NULL).
y_lab	Y-axis label (default: "Fraction of Status").
ncol	Number of columns for facet wrap when multiple screen types (default: 2).
nrow	Number of rows for facet wrap when multiple screen types (default: NULL).
scales	Should scales be fixed ("fixed"), free ("free"), or free in one dimension ("free_x", "free_y") for faceted plots (default: "fixed").

Value

A list containing:

- stats: A data frame (single screen) or list of data frames (multiple screens) with screening statistics including:
  - Grouping variable counts
  - Raw cell counts
  - Percentage fractions
- plot: A ggplot2 object (single screen) or list of ggplot2 objects (multiple screens)
- combined_plot: A combined plot using patchwork (only for multiple screens)

Visualization Details

- Bars are ordered by descending Positive fraction
- Y-axis shows percentage (0-100%)
- Zero-fraction groups are automatically hidden unless `show_null=TRUE`
- For multiple screen types, plots can be combined using patchwork

See Also

Other visualization_function: `ScreenUpset()`

Examples

```
## Not run:
# Single screen type usage
res <- ScreenFractionPlot(
  screened_seurat = scissor_result,
  group_by = "PatientID",
  screen_type = "scissor"
)

# Multiple screen types at once
multi_res <- ScreenFractionPlot(
  screened_seurat = multi_screened_result,
  group_by = "TissueType",
  screen_type = c("scissor", "scPAS", "scPP", "scAB", "DEGAS"),
  ncol = 2
)

## End(Not run)
```

ScreenUpset *ScreenUpset - Visualize cell type intersections from screened Seurat object*

Description

This function creates an UpSet plot to visualize intersections between different screening methods (e.g., scissor, scAB, scPAS, scPP) in a Seurat object metadata. It calculates all possible combinations of screening types and displays the number of cells positive for each combination.

Usage

```
ScreenUpset(
  screened_seurat,
  screen_type = NULL,
  show_plot = TRUE,
```

```
  n_intersections = 20,
  x_lab = "Screen Set Intersections",
  y_lab = "Number of Cells",
  title = "Cell Counts Across Screen Set Intersections",
  bar_color = "#4E79A7",
  combmatrix_point_color = "black",
  ...
)
```

Arguments

`screened_seurat`	A Seurat object containing screening results in metadata. Must contain columns with screening types marked as "Positive".
`screen_type`	Character vector of screening types to analyze. Default: NULL, indicating that a self-search pattern will be used.
`show_plot`	Whether to show the upset plot. Default: TRUE.
`n_intersections`	Number of intersections to display in the plot. Default: 20.
`x_lab`	Label for the x-axis. Default: "Screen Set Intersections".
`y_lab`	Label for the y-axis. Default: "Number of Cells".
`title`	Plot title. Default: "Cell Counts Across Screen Set Intersections".
`bar_color`	Color for the bars in the plot. Default: "#4E79A7".
`combmatrix_point_color`	Color for points in the combination matrix. Default: "black".
`...`	Additional arguments passed to `ggplot2::theme()` for customizing the plot appearance.

Details

The function performs the following steps:

1. Validates input parameters and checks if specified screening types exist in metadata
2. Generates all possible combinations of screening types (from 1 to the total number of types)
3. Creates a logical matrix of positive cells for efficient computation
4. Calculates cell counts for each intersection using vectorized operations
5. Creates an UpSet plot visualization with customizable appearance

Value

A list containing two elements:

- `plot`: A ggplot object displaying the UpSet plot
- `stats`: A data frame with intersection statistics including:
  - `intersection`: Name of the intersection
  - `sets`: List of screening types in the intersection
  - `count`: Number of cells positive for all screening types in the intersection

See Also

Other visualization_function: ScreenFractionPlot()

Examples

```
## Not run:
# Basic usage with default parameters
result <- ScreenUpset(screened_seurat = my_seurat_obj)

# Customize screening types and appearance
result <- ScreenUpset(
  screened_seurat = my_seurat_obj,
  screen_type = c("scissor", "scAB"),
  n_intersections = 15,
  title = "Custom Title",
  bar_color = "darkred"
)

## End(Not run)
```

SetupPyEnv *Create or Use Python Environment with Required Packages*

Description

Sets up a Python environment with specified packages for DEGAS screening methods. This function can create new environments or reuse existing ones, supporting both Conda and venv environment types. It ensures all required dependencies are properly installed and verified.

Default method for unsupported environment types. Throws an informative error with supported environment types.

Usage

```
SetupPyEnv(env_type = c("conda", "venv"), ...)

## Default S3 method:
SetupPyEnv(env_type = c("conda", "venv"), ...)
```

Arguments

env_type	Character string specifying the type of Python environment to create or use. One of: "conda", "venv".
...	Additional parameters passed to specific environment methods.

Details

This function provides a comprehensive solution for Python environment management in R projects, particularly for machine learning workflows requiring TensorFlow. Key features include:

- **Environment Creation**: Automatically creates new environments or reuses existing ones with the same name
- **Package Management**: Installs specified Python packages with version pinning support
- **Verification**: Validates environment setup and package installations
- **Flexible Methods**: Supports different backend methods for environment creation (reticulate vs system calls)

The function uses S3 method dispatch to handle different environment types, allowing for extensible support of additional environment managers in the future.

Value

A data frame containing verification results for the environment setup, including installation status of all required packages. Invisibly returns the verification results.

See Also

`reticulate::conda_create()`, `reticulate::virtualenv_create()` for underlying environment creation functions.

Examples

```
## Not run:
# Setup a Conda environment with default parameters
SetupPyEnv("conda")

# Setup a venv environment
SetupPyEnv("venv")

## End(Not run)
```

SetupPyEnv.conda *Setup Conda Python Environment*

Description

Creates and configures a Conda environment specifically designed for screening workflows. This function provides multiple methods for environment creation and package installation, including support for environment files, with comprehensive verification and error handling.

Usage

```
## S3 method for class 'conda'
SetupPyEnv(
  env_type = "conda",
  env_name = "r-reticulate-degas",
  method = c("reticulate", "system", "environment"),
  env_file = NULL,
  python_version = "3.9.15",
  packages = c(tensorflow = "2.4.1", protobuf = "3.20.3"),
  recreate = FALSE,
  use_conda_forge = TRUE,
  verbose = TRUE,
  timeout = 1800000,
  ...
)
```

Arguments

env_type	Character string specifying the environment type. For this method, must be "conda".
env_name	Character string specifying the Conda environment name. Default: "r-reticulate-degas".
method	Character string specifying the method for environment creation and package installation. One of: "reticulate" (uses reticulate package), "system" (uses system conda commands), or "environment" (uses YAML environment file). Default: "reticulate".
env_file	Character string specifying the path to a Conda environment YAML file. Used when method = "environment". Default: NULL
python_version	Character string specifying the Python version to install. Default: "3.9.15".
packages	Named character vector of Python packages to install. Package names as names, versions as values. Use "any" for version to install latest available. Default includes tensorflow, protobuf, and numpy.
recreate	Logical indicating whether to force recreation of the environment if it already exists. Default: FALSE.
use_conda_forge	Logical indicating whether to use the conda-forge channel for package installation. Default: TRUE.
verbose	Logical indicating whether to display detailed progress messages and command output. Default: TRUE.
timeout	The maximum timeout time when using system commands, default: 30 miniutes
...	For future compatibility.

Value

Invisibly returns NULL.

Note

The function requires Conda to be installed and accessible on the system PATH or through reticulate. For method = "environment", the specified YAML file must exist and be properly formatted. The function includes extensive error handling but may fail if Conda is not properly configured.

See Also

`reticulate::conda_create()`, `reticulate::py_install()` for the underlying functions used in reticulate method.

Examples

```
## Not run:
# Setup using reticulate method (default)
SetupPyEnv.conda(
  env_name = "my-degas-env",
  python_version = "3.9.15"
)

# Setup using environment file
SetupPyEnv.conda(
  method = "environment",
  env_file = "path/to/environment.yml"
)

# Setup with custom packages
SetupPyEnv.conda(
  packages = c(
    "tensorflow" = "2.4.1",
    "scikit-learn" = "1.0.2",
    "pandas" = "any"
  )
)

## End(Not run)
```

SetupPyEnv.venv *Setup Virtual Environment (venv)*

Description

Creates and configures a Python virtual environment (venv) specifically designed for screening workflows. This function provides a lightweight, isolated Python environment alternative to Conda environments with similar package management capabilities.

Usage

```
## S3 method for class 'venv'
SetupPyEnv(
  env_type = "venv",
  env_name = "r-reticulate-degas",
  python_version = "3.9.15",
  packages = c(tensorflow = "2.4.1", protobuf = "3.20.3"),
  python_path = NULL,
  recreate = FALSE,
  verbose = TRUE,
  ...
)
```

Arguments

env_type	Character string specifying the environment type. For this method, must be "venv".
env_name	Character string specifying the virtual environment name. Default: "r-reticulate-degas".
python_version	Character string specifying the Python version to use. Default: "3.9.15".
packages	Named character vector of Python packages to install. Package names as names, versions as values. Use "any" for version to install latest available. Default includes tensorflow, protobuf, and numpy.
python_path	Character string specifying the path to a specific Python executable. If NULL, uses the system default or installs the specified version. Default: NULL.
recreate	Logical indicating whether to force recreation of the virtual environment if it already exists. Default: FALSE.
verbose	Logical indicating whether to display detailed progress messages and command output. Default: TRUE.
...	For future compatibility.

Value

Invisibly returns NULL.

Note

Virtual environments require a base Python installation. If the specified Python version is not available, the function will attempt to install it using reticulate. Virtual environments are generally faster to create than Conda environments but may have more limited package availability compared to Conda-forge.

See Also

reticulate::virtualenv_create(), reticulate::virtualenv_remove(), reticulate::use_virtualenv() for the underlying virtual environment management functions.

Examples

```
## Not run:
# Setup virtual environment with default parameters
SetupPyEnv.venv()

# Setup with custom Python version and packages
SetupPyEnv.venv(
  env_name = "my-degas-venv",
  python_version = "3.8.12",
  packages = c(
    "tensorflow" = "2.4.1",
    "scikit-learn" = "1.0.2",
    "pandas" = "any"
  )
)

# Force recreate existing environment
SetupPyEnv.venv(
  env_name = "existing-env",
  recreate = TRUE
)

## End(Not run)
```

`SymbolConvert` *Convert Ensembles Version IDs & TCGA Version IDs to Genes in Bulk Expression Data*

Description

Preprocess bulk expression data: convert Ensembles version IDs and TCGA version IDs to genes. NA values are replaced with `unknown_k` format (k stands for the position of the NA value in the row).

Usage

```
SymbolConvert(data)
```

Arguments

`data`	bulk expression data (matrix or data.frame)
